summary of presentation :

commands on how to get to a specific file or directory and on how to use it.

list of commands

- pwd command : used for displaying the current working directory
- cd command : used for changing the current directory
- ls command : displaying all files in directory

Definition of following terms

- File system : a method of organizing files on physical media, such as hard disks, CD's, and flash drives

- Current directory : the directory in which a user is working at a given time. Every user is always working within a directory.

- parent directory : is a directory containing the current directory.

- the difference between your home directory and the home directory : In the Linux file system, everything comes under the root directory. The home directory contains a particular user's data.

- pathname : a statement of the location of a file or other item in a hierarchy of directories.

- relative path : is the hierarchical path that locates a file or folder on a file system starting from the current directory

- absolute path : complete details needed to locate a file or folder, starting from the root element and ending with the other subdirectories

What is the right to repair movement and why does it matter?

is to require companies to make their parts, tools and information available to consumers and repair shops in order to keep devices from ending up in the scrap heap.
